LNG Bunkering North American Summit 2025

Confirmed Speakers:

Peter Keller, Chairman, SEA LNG

Louis Sola, Chairman, Federal Maritime Commission

Dain Detillier, Executive VP - LNG Operations, Harvey Gulf International Marine

Gerben Dijkstra, Head of Business Development, Anthony Veder

Matt Jackson, Vice President Crowley Advanced Energy, Crowley

Rick Schiappacasse, Director Cargo Sales & Special Projects, Jacksonville Port Authority

Daniel Gage, President, The Transport Project

John Nadeau, RADM (ret) and President and CEO, Nadeau Maritime

Andrey Chernov, Adjunct Professor, State University of New York Maritime College

Thomas MacLean, Policy Program Director, Port of San Diego

	SITE TOUR AND WORKSHOP DAY – TUESDAY 18 TH November 2025	
08:30	WELCOME REGISTRATION	
09:30	PORT SITE TOUR	
13:00	LUNCH AND NETWORKING	
	<u>POLICY</u>	<u>LNG AND FUTURE FUELS</u>
14:30	TRAINING AND SAFETY OF ALTERNATIVE FUELS	COST COMPARISON OF ALTERNATIVE FUELS UNDER IMO COMPLIANCE
16:00	NETWORKING DRINKS HOSTED BY PIVOTAL LNG	

	CONFERENCE DAY ONE – WEDNESDAY 19 TH NOVEMBER, 2025
	REGISTRATION AND WELCOME NETWORKING
08:00	
	CHAIR'S OPENING REMARKS
08:45	
08:45	OPENING KEYNOTE PRESENTATION: UNDERSTANDING THE GROWTH OF LNG AND ALTERNATIVE FUEL
	USAGE IN NORTH AMERICAN SHIPPING
	With the growing challenge of an uncertain future for maritime fuel and energy usage, one thing is clear – that
	there is increasing demand and opportunity for LNG use in shipping, but also growing concern with
	surrounding regulatory landscapes to support this fuel pathway. Join this session to hear the regulatory and
	infrastructure perspective of how future fuels will be supported in North America. Join this session to learn:
	- Analysis on the continued importance of LNG use for future operating ships
	- What are the current regulatory frameworks that are impacting the ease of new LNG shipbuilding/ bunker
	vessels etc.

 - What key safety concerns are still arising when it comes to LNG bunkering operations, and how covercome? - How is the regulatory landscape evolving in the US to support alternatives outside of LNG? Invitation Extended to: US Coast Guard PRESENTATION: GLOBAL REGULATION SHIFTS – HOW WILL THE IMO'S MEPC OUTCOME AFFECT INDUSTRY? As the maritime industry is adapting globally to adopt lower carbon fuels, including LNG, in prepar IMO30 and IMO50 targets, there is now an even clearer sense of urgency following IMO's MEPC or 2025, but the question still stands on how the future of LNG usage in shipping will be affected by the global standards, and how might this impact the US market. Join this session to understand the formal contents of the properties of the prop	an these be

- What is the Net-Zero Framework that has been agreed by the IMO?	. 0	
- With the implementation of the NZF, how has the compliance cost of LNG changed?		
- What is the impact of the conversations at the IMO meeting in October?		
- How do shipowners need to alter their fuel strategy in comparison to prep for IMO30 and 50 targ	gets?	
09:45 PRESENTATION: TAKE A LOOK AT THE ORDER BOOKS – AND WHAT DOES THIS MEAN FOR THE IN	IDLICTBV3	
2024 saw another significant rise in alternative fuel newbuilding, with a 30% year-on-year increase		
to 2023, according to the DNV alternative fuels insight. This shows the growing importance of dev	-	
infrastructure to support this increase in demand for alternatives across the value chain.	ото р ттотте тт	
Join this session to take a closer look at the order books in the North American market, and how t	hese	
patterns affect the anticipated supply and infrastructure developments, as well as how shipbuildir	ıg	
capabilities are impacted.		
10:15 Coffee Break Announcement by Matrix Service Company		
10:20 MORNING COFFEE BREAK – Sponsored by Matrix Service Company		
11:00 PRESENTATION - MANNTEK		
11:25 PRESENTATION - TRELLEBORG		
11:50 PANEL: PIVOTAL LNG		
12:20 PANEL: PAUSE ON PRODUCTION OF BLUE AND GREEN FUELS?		
With global ship operators looking to diversify their fleets, and exploring new avenues for reducing	g their	
carbon emissions, the viability of fuels like Methanol and Ammonia come into play, and the pathw		
blue and green production. However, given the current uncertainty, there development of these f	acilities is	
not an investors priority currently. Join this panel to understand:

	CONFERENCE DAY TWO – THURSDAY 20 TH NOVEMBER, 2025
07:45	REGISTRATION AND WELCOME NETWORKING
08:15	CHAIR'S OPENING REMARKS
08:20	LEADERSHIP PANEL: US OPERATORS - FUEL STRATEGY, FLEET RENEWAL, AND NAVIGATING REGULATORY UNCERTAINTY With the new administration comes new priorities and our panel of leaders at the major shipping operators in the US are coming together to make sense of how fuel and energy strategy and priorities have changed in the past year. It is crucial currently for those across the value chain to understand how our operators are prioritizing different energy supplies and how they anticipate their future fleets to look, as we have a chicken-and-egg situation of developing relevant infrastructure and supply to support these decisions. Join this session to hear our panelists answer the following questions: - How have the new administration's planned policies affected your future fuel strategy - What are some of the LNG availability challenges you are facing, and anticipate will grow in the future - How are you collaborating across the supply chain to strengthen LNG pathways - Do you have concerns with the future pathway through bio and e-LNG? - How can we collaborate as shipping lines to support alternative fuels development

Moderator: Peter Keller, Chairman, SEALNG Matt Jackson, Vice President Crowley Advanced Energy, Crowley 09:00 CRUISE PANEL: LNG OPERATIONAL COMPLEXITY AND LAGGING BEHIND Cruise operators were early movers in the LNG-fueled vessel space, yet LNG cruise operations are still more complex to manage. Many cruise lines have a small portion of their fleet LNG propelled, but have LNG operations as the majority of their focus, due to difficult port scheduling, limited compatible infrastructure, setting the safety standard and supplier timing constraints – all challenges that pose more of a challenge in cruise, due to the high passenger numbers, and limited flexibility in timings. This panel will bring together cruise lines to discuss what it will take to make LNG adoption more efficient. Our panelists will answer the following questions: - What are the most persistent operational challenges that need the most attention to overcome? - How are cruise lines and other stakeholders across the value chain working together to tackle the wider operational challenges with LNG adoption in the cruise sector? - What is the impact of being a first mover in key cruise ports, and how can regulators, ports and suppliers better support LNG bunkering readiness? - How do commercial terms with suppliers need to evolve to reflect the realities of cruise schedules, limited bunkering windows, and tighter operational lead times? - Are LNG infrastructure investments in North and Central America meeting the specific requirements of cruise, or are container and cargo needs dominating? 09:45 PANEL: SCALING THE SMALL SCALE - PORTS DEVELOPING ALTERNATIVE FUEL BUNKERING INFRASTRUCTURE While LNG export infrastructure continues to expand across the Gulf Coast, small-scale bunkering infrastructure to serve individual vessels remains limited in North America. With European regulations driving global shippers to consider investing in alternative fuels, and IMO MEPC meetings driving this urgency further on a global scale, shipowners are looking to North America to understand where they might secure their future supply on their routes. With most ports in the Americas are still focused on large-volume exports rather than scalable bunkering services with LNG, this poses a challenge. Join this session to learn: - Which ports are actively building small-scale infrastructure for LNG, and other alternative fuels, and what had been driving this investment into the infrastructure? - What lessons can be learnt from early movers like Jacksonville, Port Canaveral, and the Panama Canal in enabling small-scale LNG bunkering? - What are the financial, safety, and compliance hurdles ports are facing in developing small-scale bunkering infrastructure? 10:15 **PANEL: FINCANTIERI** 10:50 **MORNING COFFEE BREAK** PRESENTATION: LEGAL CLARITY AROUND LNG VS. AMMONIA - GROWING CONCERN IN INSURANCE AND 11:20 REGULATORY CIRCLES While we discuss the operational and commercial viability of alternative fuels in maritime, the legal frameworks are becoming just as important for shipowners to consider. While LNG benefits from clear coverage under the IGF Code and existing P&I insurance structures, ammonia remains in a legal grey zone with no dedicated conventions for liability or compensation when used as a marine fuel. With stricter fuel regulations looming and new fuels entering the market, this session breaks down where the legal gaps lie and what they mean for shipowners, insurers, and regulators. - What are the current legal frameworks covering LNG use, and why is this seen as a key enabler for adoption? - Where does ammonia fall short in terms of international regulation, liability, and insurability? - How do existing conventions like the Bunker Convention and HNS Convention apply, and where do they fail? - What risks does the absence of legal coverage for ammonia create, and could we be heading toward a regulatory crisis point? Andrey Chernov, Adjunct Professor, State University of New York Maritime College 11:50 PANEL: SHIP OPERATOR PERSPECTIVE - FUEL AGNOSTIC OR FUEL COMMITTED IN THE US MARKET VS **EUROPE?** Global operators are facing almost contradictory regulatory pressures across regions. While US-based

operations are not following suit with European regulation, the EU still applies to vessels on transatlantic

routes and so is driving long-term investment in newbuilds and alternative fuels. This session brings together international shipowners to explore whether North America's regulatory difference, impacts fuel transition decisions, and how they are balancing global compliance with available infrastructure.

- How do global operators assess the fuel transition when operating across the US and EU markets?
- What drives investment in new fuels or dual-fuel capability when infrastructure varies between regions?
- Does the lack of clarity on US regulatory timelines delay or divert alternative fuel uptake?
- How do companies weigh the long-term need to comply with FuelEU Maritime vs the availability in the US?

12:20 PANEL: LNG SUPPLY AVAILABILITY ACROSS THE INDUSTRIES

As LNG adoption grows across multiple sectors, including road transport, aerospace, and heavy industry, the maritime sector faces increasing competition for limited supply. With players in the space industry for example, using LNG for propulsion and industrial fleets leaning into natural gas, how will the maritime supply chain remain competitive? This session unpacks the cross-sector dynamics that could shape pricing, access, and future investment for LNG for ships.

- What are the current and projected demand levels for LNG across competing industries in North America?
- How does the space industries involvement in LNG change market dynamics and infrastructure investment?
- Will trucking, rail, and industrial use disrupt existing bunkering networks or support new ones?
- What can maritime learn from these industries success in securing long-term LNG supply?

12:40 NETWORKING LUNCH

PANEL: COLLABORATION AND TECHNOLOGY TO MITIGATE METHANE SLIP

As the IMO signals potential methane slip regulation under future revisions of its GHG reduction strategy, addressing this issue is becoming unavoidable. With increased focus on lifecycle emissions, methane slip may become a costly if regulations dictates fines. This panel explores where current technology stands, what innovations are emerging, and how the sector can collaborate to reduce methane emissions across engines, bunkering, and supply infrastructure.

- 13:40
- What methane slip mitigation technologies are being trialed and where have results been most promising?
- Who is responsible for methane slip in the LNG value chain engine makers, suppliers, or operators?
- How likely is the IMO to introduce specific limits, and when?
- What initiative are helpgin industry collaboration for development of technical solutions?

14:20 PANEL: LNG BUNKER VESSEL BUILDS – NEW DEVELOPMENTS OR ROADBLOCKS?

Despite early enthusiasm for LNG bunker barges in the US Gulf, progress has slowed. Planned projects have seen delays or have gone quiet entirely. This session investigates what is holding back development - is it regulation, financing, permitting, or project complexity? With the SHIPS for America mandate aiming to expand domestic shipbuilding, what's needed to actually get more bunker vessels on the water?

- What's causing the slowdown in LNG bunker barge projects across the US?
- Are approvals, safety standards, or commercial uncertainty delaying investments?
- How is the SHIPS for America mandate expected to change the game, and is it enough?
- How does this affect LNG availability and trust in supply among shipowners?

14:50 PRESENTATION: WHAT ROLE WILL NUCLEAR PLAY IN SHIP ENERGY SOURCES

Nuclear propulsion has re-entered the conversation as an ultra-low-emission option, particularly for long-range vessels. While the technology is not new, adoption for commercial vessels brings new challenges in regulation, public perception, and infrastructure. This session explores current developments in maritime nuclear projects and whether this could become a credible pathway for decarbonisation.

- What types of nuclear technologies are being proposed for commercial shipping?
- What are the regulatory and insurance challenges involved in nuclear vessel deployment?
- Where do we stand globally in terms of nuclear R&D for shipping?
- Could nuclear be an answer for large vessels that face fuel density constraints with alternatives like ammonia and hydrogen?

15:20 PRESENTATION: THE GREAT LAKES – WILL WE ADOPT LNG AND WHAT ARE THE BARRIERS?

The Great Lakes region presents a unique case for LNG adoption. With a contained operating environment and growing interest in decarbonisation, LNG could be a practical option, but infrastructure, policy, and local

	opposition present roadblocks. This session outlines the current status of LNG in the region, the factors delaying adoption, and whether the Great Lakes could become a new growth area for alternative fuels. - What is the current LNG infrastructure footprint in the Great Lakes region? - Are there regulatory or environmental barriers unique to this inland waterway? - What is the appetite from regional ship operators for LNG or other alternative fuels? - Could future policy shifts unlock new momentum for LNG projects here?
15:50	CHAIRPERSON'S CLOSING REMARKS – THOUGHTS ON 2024 AND OBJECTIVES FOR 2025
15:55	END OF CONFERENCE
